CHREENT SERIAL RECORDS

GRAIN FG 1-64 January 1964

NEAR RECORD 1963 WORLD

BREADGRAIN CROP EXPECTED

World breadgrain production in 1963 is now estimated at 280 million short tons, based on latest information available to the Foreign Agricultural Service. This is slightly less than the first forecast. See World Agricultural Production and Trade Statistical Report, September, 1963.

Reductions from first forecasts of both wheat and rye were mainly due to lowered estimates for the Soviet Union; the full extent of the damage to grain crops there was not known at that time.

The present total of 280 million tons estimated for wheat and rye has been exceeded only twice, in 1958 and 1962. The near-record wheat crop is partly offset by the smaller rye production.

World wheat production is now estimated at 8,240 million bushels, compared with the 1955-59 average of 7,955 million and the alltime high of 8,730 million a year ago. Rye production has been declining steadily to reach a low of 1,165 million bushels in 1963, contrasting with the 1955-59 average of 1,440 million and the high of 1,495 million in 1950.

North America's wheat production of 1,923 million bushels set a new record, with outturns in Canada and Mexico at alltime highs and the U.S. crop one of the largest of record. The total is 317 million bushels above the average period though total acreage was the same; a substantial reduction in U.S. acreage was offset by Canada's increase.

The present estimate of 723 million bushels for Canada exceeds the previous high in 1952 by 21 million. Reported acreage of 27.6 million acres has been exceeded only once. Yields of 26.2 bushels per acre were also a near

WHEAT: Acreage, yield per acre, and production in specified countries, year of harvest, average 1955-59, annual 1961-63 1/

1/ Years shown refer to years of harvest in the Northern Hemisphere. Harvests of the Northern Hemisphere countries are combined with those of the Southern Hemisphere which immediately follow; thus, the crop harvested in the Northern Hemisphere in 1963 is combined with preliminary forecast for the Southern Hemisphere harvests, which begin late in 1963 and end early in 1964. 2/ Figures refer to harvested areas as far as possible. 3/ Yield per acre calculated from acreage and production data shown. 4/ Revised estimates for Northern Hemisphere countries, for Southern Hemisphere, preliminary forecasts based largely on acreage and weather conditions to date. 5/ Estimated totals which in the case of production are rounded to millions, include allowances for any missing data for countries shown and for other producting countries not shown. 6/ Tentative unofficial estimates for production. 7/ Production on European holdings only.

RYE: Acreage, yield per acre, and production in specified countries, year of harvest, average 1955-59, annual 1961-63 1/

Hemisphere which immediately follow; thus, the crop harvested in the Northern Hemisphere in 1963 is combined with preliminary forecasts for the Southern Hemisphere harvests, which begin late in 1963 and end early in 1964. 2/ Figures refer to harvested areas as far as possible. 3/ Yield per acre calculated from acreage and production data shown. 4/ Revised estimates for Northern Hemisphere countries; for Southern Hemisphere, preliminary forecasts based largely on acreage and weather conditions to date. 5/ Estimated totals which in the case of production are rounded to millions, include allowances for any missing data for countries shown and for other producing countries not shown. 6/ Tentative unofficial estimates for production. 1/ Years shown refer to years of harvest in the Northern Hemisphere. Harvests of Northern Hemisphere countries are combined with those of the Southern

record. The November estimate placed the U.S. production at 1,133 million bushels from 44.5 million acres harvested. This is one of the smallest acreages of this century. Yields of 25.5 bushels per acre, however, are among the highest of record.

Rye production in North America is less than a year ago but still above the 1955-59 average. The reduction from a year ago was in the U.S. crop; both harvested acreage and yields were less than in 1962.

Wheat production in <u>Western Europe</u> is now estimated at 1,335 million bushels. Although this is considerably below the record outturn of 1,611 million last year, it is still above average. Damage from the wet weather at harvest time appears to have been less than was feared, though quality was reduced sharply.

Rye production is still estimated at 225 million bushels, well below average. Acreage was the smallest of many years and 2 million acres below the 1955-59 average.

Wheat production in <u>Eastern Europe</u> is estimated at 625 million bushels, which is well above average, mainly because of higher yields. Rye production of 365 million bushels is the smallest since 1947.

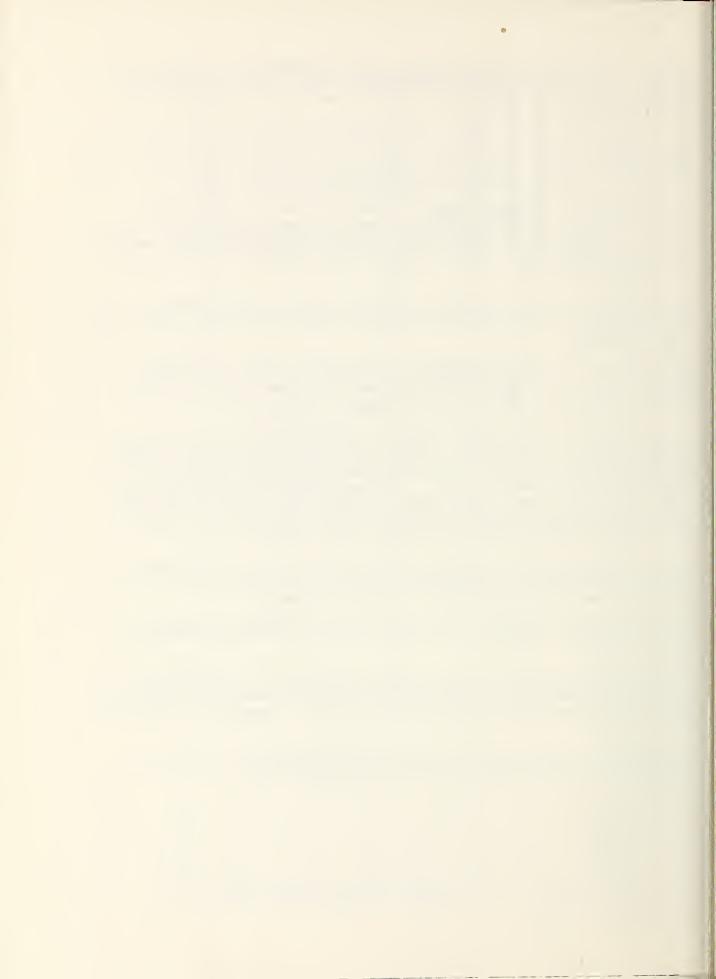

Grain production in the <u>Soviet Union</u> was reduced sharply by unfavorable growing and harvesting weather. Wheat production is indicated to be 25 percent less than in 1962. Unfavorable weather in both the winter and spring wheat areas reduced yields. This was especially true over a good part of the spring wheat region where yields were very low. Rye yields were also reduced, though not as much as wheat. The estimated outturn of 475 million bushels is the smallest since the 1920's.

Asia's wheat production of 1,995 million bushels is a record outturn. Above average acreage and high yields account for the high level. Rye production was also large because of Turkey's large crop.

Wheat production in Africa was at a new high, with expanded acreage and higher yields.

Southern Hemisphere crops are now being harvested and good outturns are reported from most areas. South America's total is forecast at 310 million bushels compared with 280 million a year ago. Argentina accounts for the increase.

In <u>Australia</u> the wheat crop is turning out better than expected and production is estimated to be near the record crop in 1962.

WORLD CORN CROP

CURRENT SEMAL RECORDS

REACHES NEW HIGH

The 1963 world corn crop is now estimated at 8,140 million bushels, on the basis of latest information available to FAS. At that level the current estimate is 7 percent above the previous record in 1960.

The world crop is turning out larger than expected earlier in the season. (See World Agricultural Production and Trade, November 1963). The increase from the earlier forecast results from larger estimates for the United States and Eastern Europe and improved prospects for the Argentine crop to be harvested beginning in March.

The unprecedented outturn of 4,081 million bushels of corn for grain in the United States accounts for half the world total. Yields were at an all-time high of 67.3 bushels per acre. The acreage harvested was 4 million acres more than in 1962 but was 11 million less than in 1960. In addition to the record U.S. harvest, Mexico's production of 250 million bushels far exceeded any previous outturn, thus further increasing the North American total over previous records. Acreage was 16.8 million acres, a million larger than in 1962. Yields were also higher.

Western Europe's corn production is still estimated at 380 million bushels, the largest of record. Production in France has been rising sharply and in 1963 was almost double the above-average 1962 harvest. Production was also larger than in 1962 in Italy and Spain. These are the three leading producers of the area.

Production in <u>Eastern Europe</u> was increased over earlier estimates and, as now estimated at 645 million bushels, is one of the largest outturns of recent years. A 5 percent increase in acreage was the principal factor in the larger production although yields were also slightly higher.

Hemisphere which follow; thus the crop harvested in the Northern Hemisphere in 1963 is combined with preliminary forecasts for the Southern Hemisphere harvest which begins early in 1964. 2/ Figures refer to harvested area as far as possible. 3/ Yield per acre calculated from acreage and production data shown. 4/ Revised estimates for Northern Hemisphere countries; for the Southern Hemisphere, revised preliminary forecasts. 5/ Corn for grain only. 6/ Estimated totals, which in the case of production are rounded to millions, include allowances for any missing data for countries shown and for other producing countries not shown, 7/ Dried corn only. 8/ Production on European holdings only. Allowances for native cultivation, not shown, are included in estimated total for 1/ Years shown refer to years of harvest in the Northern Hemisphere. Harvests of Northern Hemisphere countries are combined with those of the Southern

In the <u>Soviet Union</u>, production of corn for grain is estimated at 385 million bushels, the same as in 1962. Although this is well below the record of 500 million bushels in 1961, it is 20 percent above the 1955-59 average.

Total corn production in Asia is at an all-time high of 965 million bushels. This is 4 percent above the 1962 total and 22 percent larger than the 1955-59 average. Corn acreage has increased 18 percent since the average period.

Total corn production in <u>Africa</u> is estimated to be the same as the 640 million bushels in 1962, despite a moderate reduction in acreage. The outlook for the crop in the Republic of South Africa is very promising and a record harvest is forecast. This, together with increased crops in Egypt, Mcrocco and some smaller producers offsets reductions in still other countries.

The outlook for the approaching harvest in <u>South America</u> is mixed. Argentina's prospects are promising and offset the smaller outturn expected in Brazil. A forecast of around 235 million bushels in Argentina, if achieved, would be the largest harvest since 1947-48.

Corn is a minor crop in <u>Oceania</u> with an average crop of only some 6 million bushels.

CURRENT SERIAL RELUNDS

GRAIN FG 3-64 April 1964

NEAR-RECORD 1963 BREADGRAIN

CROP CONFIRMED

Revised estimates place 1963 world breadgrain production at 282 million short tons, slightly above the previous estimate. See World Agricultural Production and Trade--Statistical Supplement, December 1963. Latest information available to the Foreign Agricultural Service shows larger outturns than had been expected for Southern Hemisphere countries; this accounts for most of the increase. Upward revisions in wheat were especially marked in Argentina and Australia.

The present total of 282 million tons of breadgrains has been exceeded only twice. The high level is due to a near-record wheat harvest, which is only partially offset by a small rye harvest, the smallest of many years.

World wheat production is now estimated at 8,270 million bushels; only in 1958 and 1962 have there been larger world outturns. In both those years large harvests in the Soviet Union contributed to the high levels of the world total. In 1963, in contrast, the Soviet Union's crop was poor, while the total for the remainder of the world was at an alltime high.

World rye production has been declining for a number of years and reached a low point of 1,195 million bushels in 1963. This contrasts with the 1955-59 average of 1,440 million bushels and the high of 1,730 million during 1935-39.

1/ Years shown refer to years of harvest in the Northern Hemisphere. Harvests of Northern Hemisphere countries are combined with those of the Southern Hemisphere witch immediately follow; thus, the crop harvested in the Northern Hemisphere in 1963 is combined with preliminary forecasts for the Southern Hemisphere harvests, which begin late in 1963 and end early in 1964. 2/ Figures refer to harvested areas as far as possible. 3/ Yields per acre calculated hemisphere harvests, which shown a 4/ Revised estimates for Northern Hemisphere countries; for Southern Hemisphere, preliminary forecasts based largely on acreage and weather conditions to date. 5/ Estimated totals which in the case of production are rounded to millions, include allowances for any missing data for countries shown and for other producing countries not shown. 6/ Tentative unofficial estimates for production.

North America's wheat production of 1,927 million bushels is at a new high, with record harvests in Canada and Mexico and well above average in the United States. Some increase in acreage is reported for each of the three leading producers. Canada and Mexico reported higher peracre yields than in 1963 while U.S. yields remained the same both years.

Rye production in North America is reported at 42 million bushels, compared with 53 million in 1962 and the low 1955-59 average of 36 million.

Western Europe's wheat crop of 1,340 million bushels is 17 percent below the record 1962 harvest but is still above the 1955-59 average despite a somewhat smaller acreage. Both acreage and per acre yields were below the high level of 1962. Reductions were greatest in France, Italy, and the United Kingdom. West Germany is the only country showing a significant increase.

Total rye production in Western Europe, as estimated at 225 million bushels, is slightly below the 1962 harvest and about 16 percent less than during 1955-59. Acreage has declined 22 percent since that period.

Wheat production in <u>Eastern Europe</u> is estimated at 620 million bushels, slightly above the large 1962 outturn and 14 percent above the 1955-59 average. Larger outturns than last year in Yugoslavia and Poland were the principal gains and these were partly offset by reductions in most other countries of the area.

The rye harvest was only slightly above the poor 1962 crop in Eastern Europe. Increased production reported for Poland was offset by reductions elsewhere.

Poor crops of both wheat and rye were harvested in the <u>Soviet Union</u>. Unfavorable weather in the winter and spring wheat areas brought yields to the lowest point of many years. A succession of drought years in the important spring wheat area of the "new lands" had reduced soil moisture to a point that yields there were disastrously low. Production is estimated to be only three fourths of the 1962 crop of 2 billion bushels.

Rye production was also down, although the reduction was moderate compared with the sharp reduction in wheat.

Asia's 1963 wheat total has been reduced from the previous estimate mainly because of India's revised estimate. The present estimated total of 1,975 million bushels for Asia is moderately below the high level of 1962. Lower production in Japan as well as India adds to the decline. Turkey's outturn of both wheat and rye was well above the 1962 production. Rye is of minor importance in other countries of Asia.

The harvest in <u>South America</u> is now completed and conditions varied throughout the area. A larger total is now estimated because of Argentina's unexpectedly large outturn. This is partly offset, how-

ever, by a poor harvest in Uruguay and a smaller crop than last year in Chile. The present estimated total of 330 million bushels is 50 million above the 1962 harvest.

Rye production in Argentina is getting back toward normal after the very small harvest last year. The present estimate of 24.8 million bushels contrasts with 6.5 million for 1962.

<u>Australia's</u> wheat crop turned out even better than expected and set a new high of 334 million bushels. Earlier predictions were that it would approximate the record crop of 307 million bushels harvested in 1962-63. The present high level of production is attributed to a combination of near record yields and acreage that has been surpassed only twice. Rye is of minor importance in Australia.

CURRENT SEILING RECUKDS

LARGE GRAIN SUPPLY

IN EXPORTING COUNTRIES

The total grain supply in the four principal exporting countries on January 1, 1964, was one of the largest of record, according to estimates of the Foreign Agricultural Service.

Aggregate supplies of wheat, rye, barley, oats, and corn in the four countries are estimated at 256 million short tons, 8 million more than the total on January 1, 1963. Supplies are, however, 22 million tons below the peak established at the beginning of 1961. Increases over 1963 stocks are shared by all the grains but the largest increse is in corn, reflecting the larger U.S. corn stocks.

Compared with January 1963 holdings, total grain supplies show a 3 percent increase. Larger supplies are reported for each of the countries except the United States, where the total is down because of the substantial reduction in wheat supplies. This more than offset increased corn stocks. The largest increase is in Canada with a 6.4 million ton, or 19 percent gain over the 1963 total. The Argentine total is also considerably above the low level of 1963 and Australia's total is moderately higher.

In addition to the five grains covered in this report, near-record U.S. stocks of grain sorghum add to the large grain surplus in this country. January 1 stocks were 29 million short tons, about the same as a year earlier and 22 percent above the 1958-1962 average.

Wheat supplies in the four countries are estimated at 3.1 billion bushels. This is slightly above the 1963 total but well below the record 3.5 billion at the beginning of 1961. Corn stocks of 4.4 billion bushels are slightly larger than a year earlier as are barley, oats, and rye.

<sup>1/2</sup> Data for Northern Hemisphere countries represent stocks remaining on January 1; estimates for Southern Hemisphere countries include the recently harvested new crop of small grains as well as carryover stocks of old grain on January 1. 2/2 Canadian oats in bushels of 34 pounds; data for other countries in bushels of 32 pounds. 3/2 Preliminary estimates. 4/2 Production small and stocks are of minor importance.

A country breakdown shows the  $\underline{U.S.}$  total for the five grains is 191 million short tons, 3 million tons less than a year earlier and 25 million less than the record stocks on January 1, 1961. Wheat stocks of 1.6 billion bushels are 203 million bushels less than at the beginning of 1963 and are at the lowest point since January 1958. In contrast, corn stocks of 4.4 billion bushels are 136 million bushels larger than a year earlier. Barley and rye stocks are moderately lower than in 1963 and there is little change in stocks of oats.

Total grain stocks in <u>Canada</u> are estimated at about 41 million short tons. This total has been exceeded only in 1957 and 1958 and is 6 million tons more than in January 1963. Wheat stocks are estimated at 907 million bushels, compared with 765 million in 1963. The increase in wheat accounts for virtually all of the gain, although there are slight increases in the other grains.

Southern Hemisphere figures represent total supplies in the country, i.e. carryover of old grain, plus estimates for the entire harvest of small grains nearing completion in early January. Argentine corn, however, as is the case for all Northern Hemisphere grains, represents stocks of old grain on January 1 from previous harvests.

The <u>Argentine</u> grain supply is considerably above the low level of a year ago, reflecting somewhat larger outturns of small grain harvested. The total supply of 11.5 million short tons is 4 million larger than the low level in January 1963. Most of the increase is in wheat, although supplies of all the small grains show some increase.

<u>Australia's</u> grain supplies, at 12.8 million short tons, are at record level and moderately larger than a year earlier. Wheat supplies of 323 million bushels are at a new high. Supplies of oats and barley are also large.

CURRENT SERIAL RECORDS

GRAIN FG 5-64 May 1964

AND OATS CONTINUES LARGE

World production of barley and oats in 1963 was at the same high level as the 1962 total, according to latest revised estimates of the Foreign Agricultural Service. Increased barley production offset a smaller total outturn of oats.

Combined production of the two grains is estimated at about 147 million short tons, 3 percent above the 1955-59 average. The increase was entirely in barley, with oats continuing its downward trend. Most of the decline in oats was in the Soviet Union and in North America.

World barley production is now estimated at 3,995 million bushels, a new record. Increases over 1962 production are reported for all areas except the Soviet Union and Asia; the largest gain however, was in Western Europe. Total output there was 11 percent above the previous high in 1962 and 61 percent above the 1955-59 average. Western Europe's acreage has increased 32 percent since the average period and yields are somewhat higher.

World oats production of 3,215 million bushels contrasts with the 1955-59 average of 4,080 million and is the smallest world outturn of the past 50 years. Continuing its downward trend, acreage in oats totaled a little less than 80 million acres, compared with about 117 million during 1955-59. Yields have been well above average during both 1962 and 1963.

BARLEY: Acreage, yield per acre, and production in specified countries, year of harvest, average 1955-59, annual 1961-63  $\underline{1}/$

Hemisphere which immediately follow; thus, the crop harvested in the Northern Hemisphere in 1963 is combined with preliminary forecasts for the Southern Hemisphere harvests which began late in 1963 and ended early in 1964. 2/ Figures refer to harvested areas as far as possible. 3/ Yield per acre calculated from acreage and production data shown. 4/ Revised estimates for Northern Hemisphere countries, for Southern Hemisphere, preliminary forecasts. 5/ Estimated totals, which in the case of production, are rounded to millions, include allowances for any missing data for countries shown and for other producties 1/ Years shown refer to years of harvest in the Northern Hemisphere. Harvests of Northern Hemisphere countries are combined with those of the Southern not shown. 6/ Tentative unofficial estimates for production.

Hemisphere which immediately follow; thus, the crop harvested in the Northern Hemisphere in 1963 is combined with preliminary forecasts for the Southern Hemisphere harvestes which began late in 1963 and ended early in 1964. 2/ Figures refer to harvested areas as far as possible. 3/ Yield per acre calculated from acreage and production data shown. 4/ Preliminary estimates for Northern Hemisphere countries; for Southern Hemisphere, preliminary forecasts. 5/ Production and yield reported in bushels of 34 pounds. 6/ Estimated totals, which in the case of production are rounded to millions, include allowances for any missing data for countries shown and for other producines not shown. 7/ Tentative unofficial estimates for production. 1/ Years shown refer to years of harvest in the Northern Hemisphere. Harvests of Northern Hemisphere countries are combined with those of the Southern

Production of barley and oats in <u>North America</u> totaled 38 million short tons, a fourth of 1963 world production of these grains. This is slightly below the 1962 total, because of a reduction in oats, which was, however, largely offset by a larger barley crop. Area in oats has been reduced more than a fourth since 1955-59.

Western Europe's combined outturn of barley and oats was moderately larger than in 1962 because of the increase in barley. A total of 1,290 million bushels of barley is the largest of record and about 10 percent above the previous high in 1962. The large 1963 outturn is mainly due to large acreage in France and the United Kingdom, where damaged winter wheat acreage was reseeded to spring-sown feed grains. Production of oats in Western Europe is estimated at 840 million bushels, the same as in 1962. Acreage shows a further cut from the low level of 1962 but yields were increased enough to offset the acreage reduction.

Production of the two grains is about 4 percent smaller than the 1962 total in <u>Eastern Europe</u>. Most of the reduction was in barley. Smaller barley crops are reported for all countries except Poland and Yugoslavia. The largest single reduction reported is for Hungary; there both reduced acreage and smaller yields resulted in a 24 percent decrease from the high 1962 level. Oats production was slightly smaller in Eastern Europe despite a small increase in acreage.

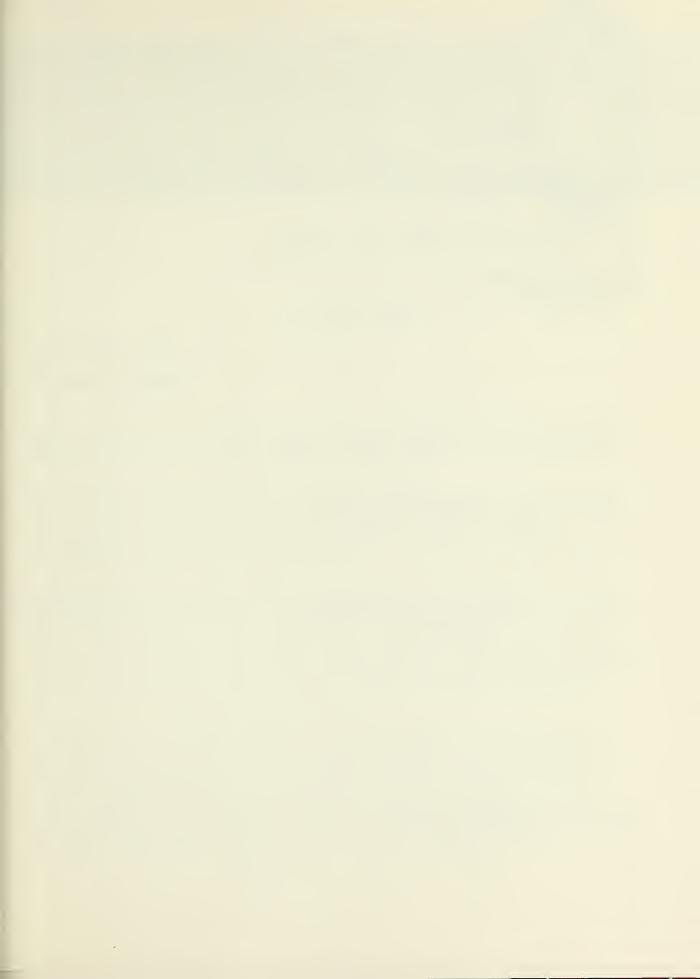

Poor crop conditions in the <u>Soviet Union</u> reduced both barley and oats outturns. Acreage of oats is estimated to be well below the 1962 area and yields were well below average.

Combined production in <u>Asia</u> is estimated to be below the 1962 outturn because of smaller barley production. Smaller crops in India, Japan and South Korea more than offset a substantial increase in Turkey. Oats production for Asia is estimated unchanged from the 1962 total.

Africa's production of barley was larger than in 1962 and also above average. The total, estimated at 155 million bushels, is the largest produced since 1956. Production of oats remained unchanged at 14 million bushels.

In <u>South America</u> the volume of the combined barley and oats production is considerably larger than in 1962 mainly because of sharp increases in Argentina. Both barley and oats harvests in that important producing country are now estimated to be more than double the small 1962 crops.

Outturns in <u>Australia</u> are also larger than a year earlier. Barley production is moderately above average and the harvest of oats is about 40 percent above average.

### RECORD WORLD CORN

### PRODUCTION CONFIRMED

Latest information available to the Foreign Agricultural Service confirms earlier forecasts of a record 1963 corn crop. See World Agricultural Production and Trade--Statistical Report, March 1964.

The current world estimate of 8,035 million bushels exceeds the previous corn record in 1960 by 6 percent. The present estimate is, however, about 100 million bushels below the earlier forecast for 1963, because of deterioration of conditions in South America, especially in Brazil, and the reduced estimate for South Africa.

North America's production in 1963 is estimated at 4,430 million bushels. Of that total the United States produced 4,081 million bushels, or 92 percent. The U.S. total is more than half of world production. This is the first time the U.S. crop has reached the 4 billion bushel mark. Record yields of 67.3 bushels per acre more than offset the below average acreage; acreage was 5.8 million acres below the 1955-59 average. Mexico's production of 245 million bushels is also a record and Canada's harvest of 32.8 million has been exceeded only once.

Corn production in <u>Western Europe</u> is still placed at an alltime high of 380 million bushels. This total is 113 million bushels above the 1955-59 average, mainly because of the sharp rise in France, where the 1963 outturn is considerably more than double the average production. Increases are also recorded for Italy and Spain, the next largest producers of the area. Larger crops in all the principal producing countries are attributed to higher yields coupled with some area increase, except in Italy, where acreage is smaller.

CORN: Acreage , yield per acre, and production in specified countries, year of harvest, average 1955-59, annual 1961-63 1/

1/ Years shown refer to years of harvest in the Northern Hemisphere. Harvests of Northern Hemisphere countries are combined with those of the Southern Hemisphere harvest which follow; thus the crop harvested in the Northern Hemisphere in 1963 is combined with preliminary forecasts for the Southern Hemisphere harvest which began early in 1964, 2/ Figures refer to harvested area as far as possible. 3/ Yield per acre calculated from acreage and production data shown. 4/ Revised estimates for Northern Hemisphere countries; for the Southern Hemisphere, revised preliminary forecasts. 5/ New series covering corn for grain only. 6/ Estimated totals, which in the case of production are rounded to millions, include allowance for any missing data for countries shown and for other producing countries not shown, 1/ Dried orn only. 8/ Production on European holdings only. Allowances for native cultivation, not shown, are included in estimated total for Africa.

Foreign Agricultural Service. Prepared or estimated on the basis of official statistics of foreign governments, other foreign source material, reports of U.S. Agricultural Attaches and Foreign Service Officers, results of office research and related information. Eastern Europe's corn outturn in 1963 has been surpassed only twice. Higher yields, especially in the Danube Basin countries, offset reduced acreage. Increased use of hybrid varieties and of fertilizer in some countries contributed to the high yields.

Production of corn for grain in the <u>Soviet Union</u> is still estimated at 385 million bushels, the same as in 1962. This is 20 percent above the 1955-59 average but is 23 percent below the record harvest of 1961.

Corn production in Asia is at a new high of 970 million bushels, compared with the 1955-59 average of 790 million. Most of the increase is due to expanded acreage, with the 1963 area of 55.9 million acres 20 percent above the average. Largest numerical gains are in India and Indonesia but the largest percentage increase is in Thailand. That country's acreage has more than tripled and production is more than 4 times the 1955-59 average.

Total production in <u>Africa</u> is estimated at a lower figure than was expected earlier. The reduction is especially marked in the Republic of South Africa where drought has reduced prospects for the crop now being harvested. The present estimate of 580 million bushels for all Africa, although well below the previous harvest, is still 26 percent above the 1955-59 average.

South America's total is now estimated at 625 million bushels. This is below the level of the past 3 years but is 12 percent above the 5 year average. The reduction from the large 1962 total is mainly in Brazil, where the crop is reported to be sharply reduced. The Argentine harvest, in contrast, may be the largest of recent years.

Corn is of minor importance in Oceania and the total is currently estimated at the 1962 level of 8 million bushels.

GRAIN FG 7-64 October 1964

## EXPORTING COUNTRIES' JULY 1

### GRAIN STOCKS SLIGHTLY LARGER

Total grain stocks in the four leading exporting countries on July 1, 1964 were about 2 percent above the mid-1963 level, according to preliminary estimates of the Foreign Agricultural Service. Despite the slight increase, stocks were still considerably below the high level of 1959-1962. The increase over 1963 is principally in corn; wheat stocks are the smallest since 1953.

An estimated total of 139 million short tons of wheat, rye, barley, oats, and corn for the current season is 3 million above stocks on July 1, 1963. Principal changes are in corn and wheat; an increase of 7.7 million short tons of corn is largely offset by a reduction of 6.7 million tons of wheat. Moderate increases were estimated for barley, oats, and rye. An 11 percent increase in U.S. corn stocks is the main factor, accounting for 85 percent of the increase in corn. The United States also accounts for most of the decline in wheat stocks.

In addition to the five grains under consideration here, July 1 stocks of grain sorghum add another 20 million tons to U.S. total grain stocks. Argentina is the only other producer of any significance and, even with recent expansion there, production is still less than 10 percent of U.S. production.

Current grain supplies continue to offer large surpluses for export. Import requirements for the current season, however, are expected to be somewhat smaller than the large 1963-64 imports.

A good wheat crop in the Soviet Union this year will reduce import needs to normal levels, after the sizable imports of a year ago, when the harvest was much below average. Western Europe's wheat requirements will also be down since total production there is estimated to be a near-record one. Japan's wheat production is 70 percent above the poor 1963 harvest. Although not yet back to average, an increase of that magnitude will

reduce import needs below the 139 million bushels of wheat imported during the year ended June 30, 1964. Mainland China's wheat production is also reported to be somewhat larger than last year and should reduce imports below the high level of the past 2 years. India, in contrast, had a reduced outturn and will need larger imports.

Increased competition for existing markets can be expected from European exporters, especially France. A good outturn in that country is expected to increase exports to about 115 million bushels during the current marketing season. Sweden's crop is larger this year and that country will be back on a net export basis. Spain is the one exception to the good harvests in Europe's exporting countries this year. A poor outturn there will keep Spain a net importer again this season.

Total U.S. supplies of wheat for 1964-65 are estimated at 2,190 million bushels, 6 percent below the 1963-64 supply because of reduced carryover. Canada's supply of 1,057 million bushels at the beginning of its 1964-65 season was 13 percent less than a year earlier, with both carryover stocks and production less than a year ago.

Mid-season wheat stocks in Argentina are double those of July 1, 1963 but the outlook for the crop to be harvested beginning in November is for a somewhat smaller outturn. Australia's crop is expected to be up to the record level of 1963 but July 1 stocks are less than a year ago, reflecting the heavy export movement.

A regional breakdown of July 1 stocks shows the <u>U.S.</u> total of 101 million short tons of the five grains accounting for 73 percent of the total for the four countries. This is the smallest volume since 1958 and is 29 million tons less than the record 1961 stocks. Wheat stocks are down 295 million bushels from the 1963 level, offsetting an increase of 230 million bushels of corn. Stocks of oats are up 41 million bushels, while barley and rye stocks are moderately smaller than a year ago.

July 1 grain stocks in <u>Canada</u> are estimated at 23 million tons, compared with 21 million in 1963. The increase was shared by all the grains. A record outturn of wheat in 1963 built supplies to a new high, but unprecedented exports brought July stocks considerably below the high level of 1954-1961.

Grain stocks in the 2 Southern Hemisphere exporting countries on July 1 are in a different category from those in North America. In Southern Hemisphere countries these are mid-season supplies which must cover all needs to the end of the current crop season and for carryover. Thus, stocks of small grains in Argentina and Australia are for consumption or export up to December 1 and corn to April 1 of the following year, the beginning of the new season. In contrast, July 1 stocks in North America approximate the year-end carry-over of small grains. Stocks represent actual carry-over into the new season in the United States, while in Canada the marketing season starts August 1. For corn, the U.S. marketing season begins October 1.

U. S. DEPARTMENT OF AGRICULTURE POSTAGE AND FEES PAID

Argentina's grain stocks remaining on July 1, 1964 are estimated at 10 million short tons compared with 6 million a year earlier. Wheat and corn stocks were much larger than in July 1963. Harvests in 1963-64 showed good increases for both crops but exports did not increase proportionately.

Grain stocks of 4.8 million bushels in Australia were smaller than at the beginning of July 1963. Production of wheat was at an all-time high but heavy export movement brought stocks down, and a minimum carryover is expected on November 30, the end of the marketing season.

GRAIN FG 8-64 October 1964

GRAIN CROP FORECAST

Breadgrain production for 1964 promises to set a new record on the basis of preliminary information available to the Foreign Agricultural Service. Northern Hemisphere harvests are nearing completion, and there is little doubt that total production will be at a new high. Principal producing countries of the Southern Hemisphere have a favorable outlook and expect good outturns if growing conditions continue favorable through November.

World production of wheat and rye, together is forecast at 303 million short tons. This has been approached only once; in 1958 it was almost that large. The high level of the current forecast is due to the prospective record harvest of wheat. As currently placed at 8,985 million bushels this would exceed the previous record in 1962 by 225 million bushels. Rye production continues at the reduced level of 1.2 billion bushels, 17 percent below the 1955-59 average.

Present forecasts are tentative and subject to change as revised estimates become available for Northern Hemisphere countries and as crops develop in the later harvesting Southern Hemisphere. Thus, growing conditions through late November will determine yields in Argentina and Australia, the largest producers of that hemisphere.

In contrast with last year, when Europe's wet season resulted in quantities of wet, low quality wheat, most areas report good quality grain, harvested this season. This in itself would reduce Western Europe's import needs this season and, coupled with an increase of almost 200 million bushels in this year's production there, it seems likely that import needs will be restricted to strong wheat for blending with the weaker indigenous wheat, in milling.

1/ Years shown refer to years of harvest in the Northern Hemisphere countries are combined with those of the Southern Hemisphere which
immediately follow; thus, the crop harvested in the Northern Hemisphere in 1964 is combined with preliminary forecasts for the Southern Hemisphere harvests which will begin
late in 1964 and end early in 1965. 2/ Figures refer to harvested areas as far as possible. 3/ Yield per acre calculated from acreage and production data shown.
4/ Perliminary estimates for Northern Hemisphere countries; for Southern Hemisphere, preliminary forecasts based largely on acreage and weather conditions to date.
5/ Estimated totals, which in the case of production are rounded to millions, include allowances for any missing data for countries shown and for other production on European holdings only.

Foreign Agricultural Service. Prepared or estimated on the basis of official statistics of foreign governments, other foreign source material, reports of U.S. Agricultural Attaches and Foreign Service Officers, results of office research, and related information.

Hemisphere shown refer to years of harvest in the Northern Hemisphere. Harvests of Northern Hemisphere countries are combined with those of the Southern Hemisphere which immediately follow; thus, the crop harvested in the Northern Hemisphere in 1964 is combined with preliminary forecasts for the Southern Hemisphere harvested areas as far as possible. 3/ Yield per acre calculated from acreage and production data shown. 4/ Preliminary estimates for Northern Hemisphere countries, for Southern Hemisphere, preliminary forecasts based largely on acreage and weather conditions to date. 5/ Estimated totals, which in the case of production are rounded to millions, include allowances for any missing data for countries shown and for other producing countries not shown. 5/ Tentative unofficial estimates for production.

Foreign Agricultural Service. Prepared or estimated on the basis of official statistics of foreign governments, other foreign source material, reports of U.S. Agricultural Attaches and Foreign Service Officers, results of office research, and related information.

The outlook is for much reduced wheat import requirements in a number of countries that were quite active in the market during 1963-64. Foremost is the Soviet Union where crop failures made large imports imperative and about 380 million bushels were imported during 1963-64. A normal outturn this year is expected to curtail imports to a relatively small amount shipped from the west coast of Canada to areas that present transportation problems for home grown wheat. At the same time exports are also expected to be well below average.

Mainland China was another large importer outside usual trade patterns. Imports came to about 205 million bushels during 1963-64. The crop outturn there this year is reported larger but imports will probably continue, though at a reduced rate.

Usual markets in Western Europe will, as mentioned above, be curtailed. An exception is the Iberian Peninsula where crops are down. Both Spain and Portugal have smaller crops and larger import requirements.

Japan's outturn is much larger than the poor 1963 harvest and import requirements should be smaller. In contrast, India's production is less than a year ago and imports may increase.

Total wheat production in North America is estimated at 1,960 million bushels, a near record. Canadian production is 18 percent below the record harvest last year but U.S. and Mexican crops are considerably larger than a year ago. The United States harvest of 1,290 million bushels from 49 million acres gives yields averaging 26.3 bushels per acre, the second largest of record. Canada's crop of 596 million bushels from a record area of 29.7 million acres shows yields of only 20.1 bushels per acre, compared with the high yield of 26.2 bushels per acre in 1963. Mexico's outturn is reported at an all-time high of 73 million bushels with yields of 37.2 bushels.

Rye production is slightly above the 1963 total with the increase in the United States. Canada's crop shows little change from a year ago.

Wheat production in <u>Western Europe</u>, as estimated at 1,560 million bushels, has been exceeded only once, in 1962. Yields of 33.9 bushels per acre are 8 percent above the 1963 average and quality of the grain is generally much better than a year ago. Larger crops than last year are reported for all important producers except Spain and Portugal. The largest numerical increase is in France, up 112 million bushels. Rye production in Western Europe, as estimated at 240 million bushels, is moderately larger than in 1963 but about 10 percent below the 1955-59 average.

<u>Eastern Europe's</u> total wheat production shows little change from a year ago despite variations from country to country. According to preliminary information the principal differences are increased production in Hungary and a smaller outturn in Yugoslavia. Little net change is estimated for rye production, compared with 1963.

The <u>Soviet Union's</u> wheat acreage for the 1964 harvest was reported in July as about 7 million acres above total 1963 acreage. The latest reported figure for 1963 was approximately 160 million acres, indicating a total this year of 167 million acres. This would be a near-record acreage but with a smaller than normal proportion in high-yielding winter wheat. The acreage increase took place despite considerable damage to winter wheat planted during a dry fall, which necessitated extensive reseeding. A late spring delayed seeding of acreage in many regions.

Growing conditions varied considerably among different regions; in the west and south there was an early summer drought, whereas the east, including much of the new lands area, had abundant moisture; in fact, excessive wetness interferred with the harvest and crops suffered from lodging. It is tentatively expected that wheat production this year will approximate the 1959-62 average. During that period the Soviet Union exported considerable quantities of grain and imports were insignificant. The current situation represents a marked improvement over the poor 1963 harvest. Official statements indicate that the Soviet Government intends to concentrate on replenishment of depleted grain stocks, and exports are not expected to be large.

Asia's wheat production is estimated at an all-time high of 1,955 million bushels. Better prospects than last year in Mainland China account for most of the increase. Japan's crop is also much larger than a year ago. Crops in India and Turkey are somewhat below the 1963 level. Turkey is the only rye producer of significance in the area and the rye crop is also smaller than in 1963.

Wheat production is smaller than last year in <u>Africa</u> mainly because of reductions in Algeria and Egypt. Rye production is insignificant in Africa.

<u>South America's</u> harvest will begin in November and the present outlook is for an average wheat crop, but considerably below the large 1963 harvest.

Early season prospects are good in <u>Australia</u> and a wheat outturn approaching the record 1963 harvest is expected. A record acreage is reported and conditions to date are generally favorable.

CURRENT SERIAL RECORDS

GRAIN FG 9-64 November 1964

RECORD WORLD BARLEY,

OATS PRODUCTION

Combined production of barley and oats in 1964 is expected to be at the same level as the record world production in 1963, according to forecasts of the Foreign Agricultural Service. A record barley crop is expected to offset a reduced outturn of oats, a continuation of the downward trend in oats since the mid-Fifties.

Production of these two grains for the current season is fore-cast at 149 million short tons, the same as a year ago, and moderately above the 1955-59 average of 143 million tons. Compared with last year's total, the barley crop forecast is about 4 million tons larger, and oats 4 million tons smaller.

World barley production is forecast at the record total of 4,210 million bushels. Record production in Western Europe and the Soviet Union accounts for the high level of the barley crop. Higher yields than in 1963 made the increase possible.

World production of oats, as forecast at 2,970 million bushels, is the smallest total of the past 50 years. Acreage has been reduced sharply, diminishing over 40 million acres from the 1955-59 level. Acreage reductions have been reported for most important producing areas, but have been largest in the Soviet Union, North America, and Western Europe.

World trade in these grains is expected to remain near the total of the past marketing season. It seems likely, however, that there will be larger import requirements for oats and smaller imports of barley than during 1963-64.

1/ Years shown refer to years of harvest in the Northern Hemisphere. Harvests of Northern Hemisphere countries are combined with those of the Southern Hemisphere which immediately follow; thus, the crop harvested in the Northern Hemisphere in 1964 is combined with preliminary forecasts for the Southern Hemisphere harvests which will begin late in 1965. 2/ Figures refer to harvested areas as far as possible. 3/ Yield per acre calculated from acreage and production data shown. Preliminary estimates for Northern Hemisphere countries; for Southern Hemisphere, preliminary forecasts based largely on acreage and weather conditions to date. 5/ Estimated totals, which in the case of production, are rounded to millions, include allowances for any missing data for countries shown and for other producting countries not shown. 6/ Unofficial estimates for production.

Foreign Agricultural Service. Prepared or estimated on the basis of official statistics of foreign governments, other foreign source material, reports of U.S. Agricultural Attaches and Foreign Service Officers, results of office research, and related information.

1/ Years shown refer to years of harvest in the Northern Hemisphere. Harvests of Northern Hemisphere which harvests of Northern Hemisphere in 1964 is combined with preliminary forecasts for the Southern Hemisphere harvests which will immediately follow: thus. the crop harvested in the Northern Hemisphere in 1964 as do and one acreage and production data shown. Legin late in 1964 and end early in 1965. 2/ Figures refer to harvested areas as far as possible. 3/ Yield per acre calculated from acreage and production data shown. 4/ Pereliminary estimates for Northern Hemisphere countries: for Southern Hemisphere, preliminary forecasts based largely on acreage and weather conditions to date. 5/ Production and yield reported in bushels of 34 counds. 6/ Estimated totals. which in the case of production are rounded to millions, include allowances for any missing data for countries shown and for other producing countries not shown. 7/ Unofficial estimates for production.

Foreign Agricultural Service. Preoared or estimated on the basis of official statistics of foreign governments, other foreign source material, reports of U.S. Agricultural Attaches and Foreign Service Officers, results of office research and related information.

Production of barley and oats in North America amounted to a little less than a fourth of the 1964 world total. Both crops were smaller than last year. Barley production of 562 million bushels was 67 million bushels less than in 1963. Acreage was smaller in both Canada and the United States. Barley yields in the United States were at an all-time high of 36.2 bushels per acre; this held production near the 1963 level despite an acreage cut. In Canada, in contrast, both acreage and yields were somewhat below the 1963 figures and production was about 30 percent below average.

Oats production of 1,251 million bushels in 1964 is well below the 1963 total of 1,440 million and the 1955-59 average of 1,660 million. The 1964 area of 29.2 million acres is below the 31.5 million acres in 1963 and only two-thirds of the 1955-59 average.

Barley production established a new record in <u>Western Europe</u> with 1,305 million bushels, a gain of 505 million bushels over the 5-year average. Gains were in both <u>acreage</u> and yields. Production gains over 1963 were especially marked in the United Kingdom, Scandinavia, and West Germany. Those increases more than offset substantial reductions in France and Spain.

Western Europe's production of oats is estimated at 790 million bushels, compared with 850 million a year ago and the 1955-59 average of 935 million. Reductions were fairly widespread but the largest was in France where reduced acreage and smaller yields resulted in a 44 million bushel crop reduction.

Total barley production in <u>Eastern Europe</u> is estimated to be the same as in 1963, with larger outturns in some countries offsetting reductions in others. Acreage is estimated slightly larger and yields slightly smaller than in 1963. Oats production in this region is slightly below the 1963 total, because of reduced acreage.

Prospects are good for a record barley crop in the Soviet Union this year. Barley acreage almost doubled from 1960 to 1963; it is probable that the 1964 acreage was at least as great as the 50.6 million acres harvested in 1963. Growing conditions were better than average, and much better than last year, especially in Siberia and Kazakhstan. The oat crop in the Soviet Union probably will be somewhat better than last year —due to improved growing conditions — but still much below the

1955-59 average. A precipitous decline in the acreage sown to oats since 1959 is the principal reason for the decline in output.

Asia's barley production of 755 million bushels is less than the 820 million of 1963 and the 1955-59 average of 845 million bushels. The principal reduction is in the Near East and India. Good increases for Japan and the Republic of Korea partly offset those losses. Oats production in Asia is moderately smaller because of a reduction in Turkey.

Barley production is smaller than the large harvest last year in <u>Africa</u> but is still up to the 1955-59 average. Both acreage and yields are below the 1963 totals. Production of oats is relatively unimportant in Africa. The current crop is estimated to be an average one of 15 million bushels.

No definite indications of the coming Southern Hemisphere crops are yet available. Harvesting begins about the beginning of December and growing conditions up to that time will determine outturns.

Based on preliminary information, <u>South America's</u> barley production may be the same as in 1963. Acreage is estimated slightly larger and yield prospects are generally good. Total production may be slightly below the average crop harvested last year. Yield prospects are above average but acreage is estimated to be below average.

<u>Australia's</u> outturn of these crops is expected to show little change from the 1963 harvest. Growing conditions are generally good and little change in acreage is reported.

## CORN CROP FORECAST

The 1964 world corn crop will be second only to the record harvest in 1963, according to preliminary forecasts of the Foreign Agricultural Service. The world total is tentatively placed at 7,755 million bushels, 300 million less than last year's record.

A 13 percent reduction in the U.S. outturn is the principal change, though Western Europe's total is also down because of a sharp drop in France's production. These reductions much more than offset increases in other areas. The U.S. crop, at its lower level, represents 46 percent of world production, compared with 51 percent in 1963.

Combining the corn forecast with earlier forecasts for barley and oats, a total outturn of 366 million short tons of these three feed grains is indicated. This is about 2 percent below the record level of 374 million tons in 1963 but is 13 percent above the 1955-59 average. Compared with a year ago, smaller outturns of corn and oats were partly offset by a record barley crop.

World trade in feed grains is expected to continue its upward trend in 1964-65. The most important markets will continue to be the United Kingdom, Japan, Spain, and Italy. Imports into other Western European countries may decline slightly because of larger production of feed grains and other feedstuffs in 1964.

North America's corn production is estimated at 3,920 million bushels, 515 million less than the record 1963 harvest. A reduction of 541 million bushels in the U.S. crop is due to a 4 percent cut in acreage and smaller yields. Most other North and Central American countries have larger harvests than a year ago. The increase is especially marked in Canada where a crop of 53 million bushels sets a new record and is 47 percent above the good 1963 outturn. Reported yields of 80 bushels per acre are about 20 bushels per acre above the U.S. yields.

follow; thus, the crop harvested in the Northern Hemisphere in 1964 is combined with preliminary forecasts for the Southern Hemisphere harvest which will begin early in 1965. 2/ Figures refer to harvested area as far as possible. 3/ Yield per acre calculated from acreage and production data shown. 4/ Preliminary estimates for Northern Hemisphere countries; for the Southern Hemisphere, preliminary forecasts. 5/ Corn for grain only. 6/ Estimated totals, which in the case of production are rounded to millions, include allowances for any missing data for countries shown and for other producing countries not shown. 7/ Production on European holdings only. Allowances 1 Years shown refer to years of harvest in the Northern Hemisphere. Harvests of Northern Hemisphere countries are combined with those of the Southern Hemisphere which for native cultivation, not shown, are included in estimated total for Africa.

Foreign Agricultural Service. Prepared or estimated on the basis of official statistics of foreign governments, other foreign source material, reports of U.S. Agricultural Attaches and Foreign Service Officers, results of office research and related information.

Corn production is smaller in <u>Western Europe</u>, with an estimated 320 million bushels well below the record 1963 production of 385 million. A sharp reduction in France's crop accounts for the drop. As reported at 77 million bushels, production there is little more than half the record harvest of 152 million a year ago. Production is larger than last year in Italy and Spain, the other important producers.

Preliminary reports indicate a bumper corn crop in <u>Eastern Europe</u>. Most of the increase is reported for Rumania and Yugoslavia, but firm estimates are not yet available. Acreage is reported larger than in 1963 and with higher yields.

Corn production is also estimated to be significantly larger in the <u>Soviet Union</u>. Some acreage reduction from the high level of the past 3 years is estimated, but yields appear to have been good.

<u>Asia's</u> production is estimated to be moderately larger than in 1963, which was at an all-time high. Most of the principal producers shared in the modest increase.

The outlook is good for an increase in <u>Africa</u> but, since some of the principal producers are in the Southern Hemisphere, it is too early for a definite appraisal and conditions between now and harvest time in early 1965 will determine the final outcome.

In <u>South America</u>, also, the crop is in the early growth stage and conditions up to March/April may change the outlook, which is presently good. Thus forecasts are subject to considerable revision as the growing season alvances. If the season is normal or better, the crop should be well above the poor harvest of early 1964 in Brazil, the leading producer of the continent.

Corn is of minor importance in Oceania and a crop of 7 million bushels is forecast.
